## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Glintz (US 6,672,349, of record) and further in view of Imamura (US 4,214,058, of record) and Sandstrom (US 5,328,949, of record).

Glintz is directed to a runflat tire construction comprising a runflat support member formed of a ring-shaped metal shell 2 and rubber elastic members 21,22. In this instance, Glintz generally teaches the use of elastic rubber compositions having different fillers and additives (Column 4, Lines 22-37). While Glintz fails to disclose a specific composition for the aforementioned rubber elastic members, the claimed rubber composition is consistent with those compositions commonly used in the tire industry (in general), as shown for example by Imamura (Column 1, Lines 5-10. Column 2, Lines 15, Column 3, Lines 40-50, and Column 4, Lines 4-10). One of ordinary skill in the art at the time of the invention would have been particularly motivated to use the composition of Imamura since it is described as having a high degree of adhesion to metals (Column 1, Lines 5-10) and the method of Glintz involves a rubber, elastic member that is bonded/attached to a metal rim and a metal shell.

Art Unit: 1791

In describing the composition, Imamura suggests 100 phr of at least diene based rubber, sulfur (5 phr in single example- Table 1), 0.01-1 phr of cobalt acetyl acetonate, carbon black, and silica. The reference further suggests that "other conventional compounding agents may be suitably added to the rubber composition" (Column 4, Lines 1-3). One of ordinary skill in the art at the time of the invention would have found it obvious to include a silica coupler since such an additive is conventionally used in combination with silica in order to improve the reinforcing effect of silica, as shown for example by Sandstrom (Column 1, Lines 35-64). It is emphasized that silica couplers are conventionally used in tire rubber compositions for the aforementioned benefits. It is further noted that applicant has not provided a conclusive showing of unexpected results to establish a criticality for the claimed composition.

Lastly, with respect to the independent claim, the claimed amounts for the carbon black, silica, and silica coupler are consistent with conventional tire rubber compositions, as shown for example by Sandstrom (Column 2, Lines 40-62).

Regarding claim 2, as is conventional in the tire industry, the rubber composition of Glintz in view of Sandstrom would include sulfur at a loading between 1 and 10 phr (see Example in Table 1).

With respect to claims 3 and 7, the supporting members of Glintz are arranged between the metal shell.

Regarding claims 4, 8, 9, and 17, Glinz suggests the preferred use of aluminum or an aluminum alloy (Column 4, Lines 20-30). One of ordinary skill in the art at the time of the invention would have recognized the language as being generally directed to

metallic materials, it being well recognized that steel and stainless steel are two of the most common metallic materials. Furthermore, applicant has not provided a conclusive showing of unexpected results to establish a criticality for the use of steel or stainless steel.

As to claims 5, 10, 11, 12, and 18-20, one of ordinary skill in the art at the time of the invention would have been able to appropriately select the bond area in order to obtain a sufficient degree of adhesion between the supporting members and the ring torus- absent any conclusive showing of unexpected results, one of ordinary skill in the art at the time of the invention would have found it obvious to have a ratio S/R of at least 4.5. It is noted that this ratio suggests that the minimum bond area increases with an increase in tire size, as would be expected since larger tires would need increased reinforcement.

With respect to claims 6 and 13-16, it appears from Figure 3 that the bonding surface is comprised of an axial and radial surface.

## Response to Arguments

3. Applicant's arguments filed July 29, 2008 have been fully considered but they are not persuasive.

Applicant initially points to the results of Table II, particularly Standard Example 1, Example 7, Example 9, and Comparative Example 5. However, as set forth in the previous rejection, these results do not provide a conclusive showing of unexpected results. While Examples 7 and 9 demonstrate improved peeling strength, and thus durability, it is unclear if the realized benefits are directly attributable to the amount of

Art Unit: 1791

carbon black, the amount of silica, the carbon black/silica ratio, and/or the amount of silica coupling agent (multiple parameters are varied between examples). As set forth in the previous communication, it is suggested that applicant compare the inventive compositions to those having the same amount of filler (combined amounts of carbon black and silica), silica coupling agent, and sulfur but having different ratios between the carbon black and silica that fall outside the claimed range.

It is agreed that no single prior art reference of record teaches a combination of cobalt acetyl acetonate and carbon black and silica having the specified weight ratios. However, as set forth in the rejection above, one of ordinary skill in the art at the time of the invention would have found it obvious to use the composition of Imamura in the tire of Glintz since it is described as providing a high degree of adhesion with metals and such is the arrangement in the tire of Glintz. In this instance, the composition of Imamura can include cobalt acetyl acetonate, carbon black, and silica. As to the specific ratios of carbon black and silica, Sandstrom provides evidence that the claimed values are consistent with those used in the tire industry. It is emphasized that the composition of Imamura does contain carbon black and silica (and cobalt acetyl acetonate)- it appears that the reference is not particularly concerned with the ratio of these fillers and applicant has not provided a conclusive showing of unexpected results to establish a criticality for the claimed ratios (as set forth above).

## Conclusion

4. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Application/Control Number: 10/577,131 Page 6

Art Unit: 1791

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Justin R. Fischer** whose telephone number is **(571) 272-1215**. The examiner can normally be reached on M-F (7:30-4:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richard Crispino can be reached on (571) 272-1226. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
